Chameleon Mechanism

- We will assume a field potential of the form:

$$V(\phi) = \Lambda^4 \left(1 + \left(\frac{\Lambda}{\phi} \right)^n \right)$$

- The static field equation is therefore:

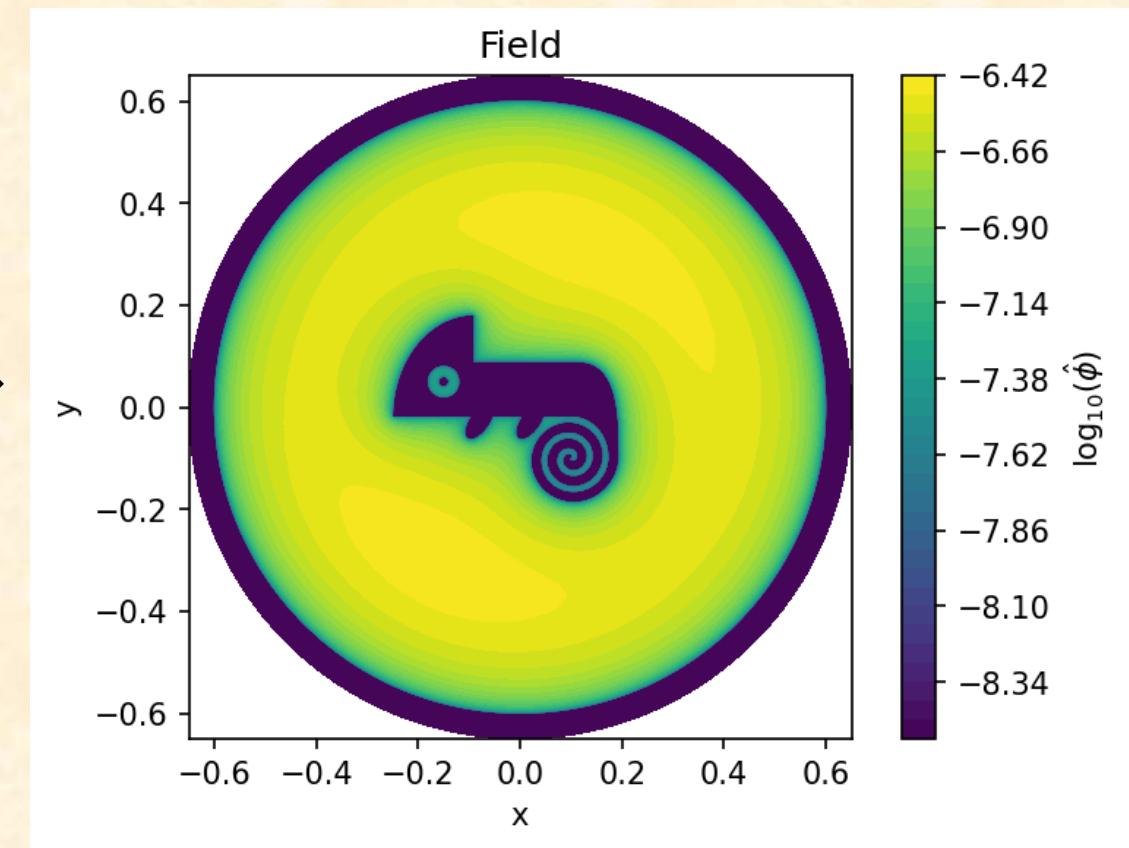

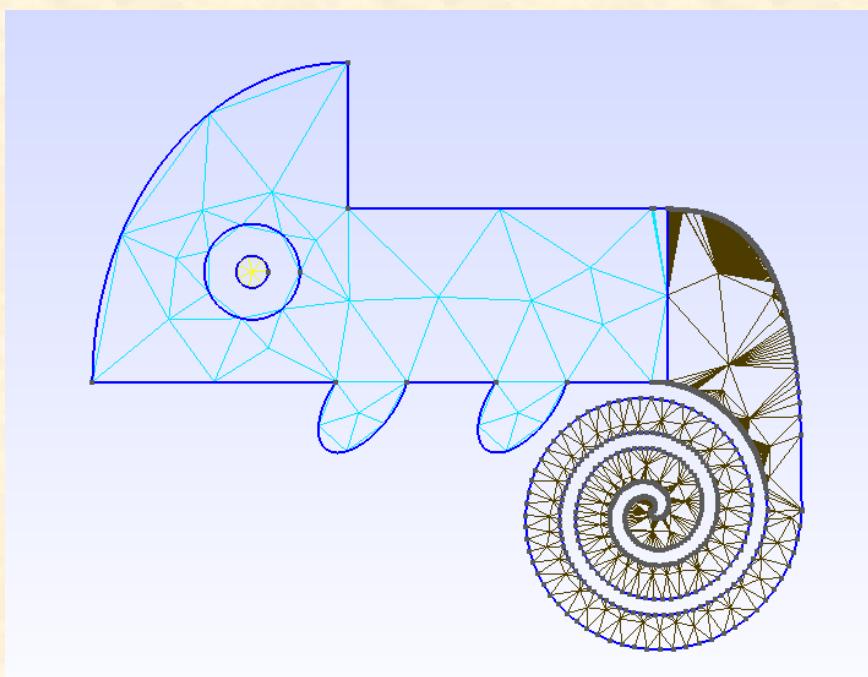

$$\nabla^2 \phi = - \frac{n \Lambda^{n+4}}{\phi^{n+1}} + \frac{\beta \rho}{M_{pl}}$$

- The corresponding a Compton wavelength of:

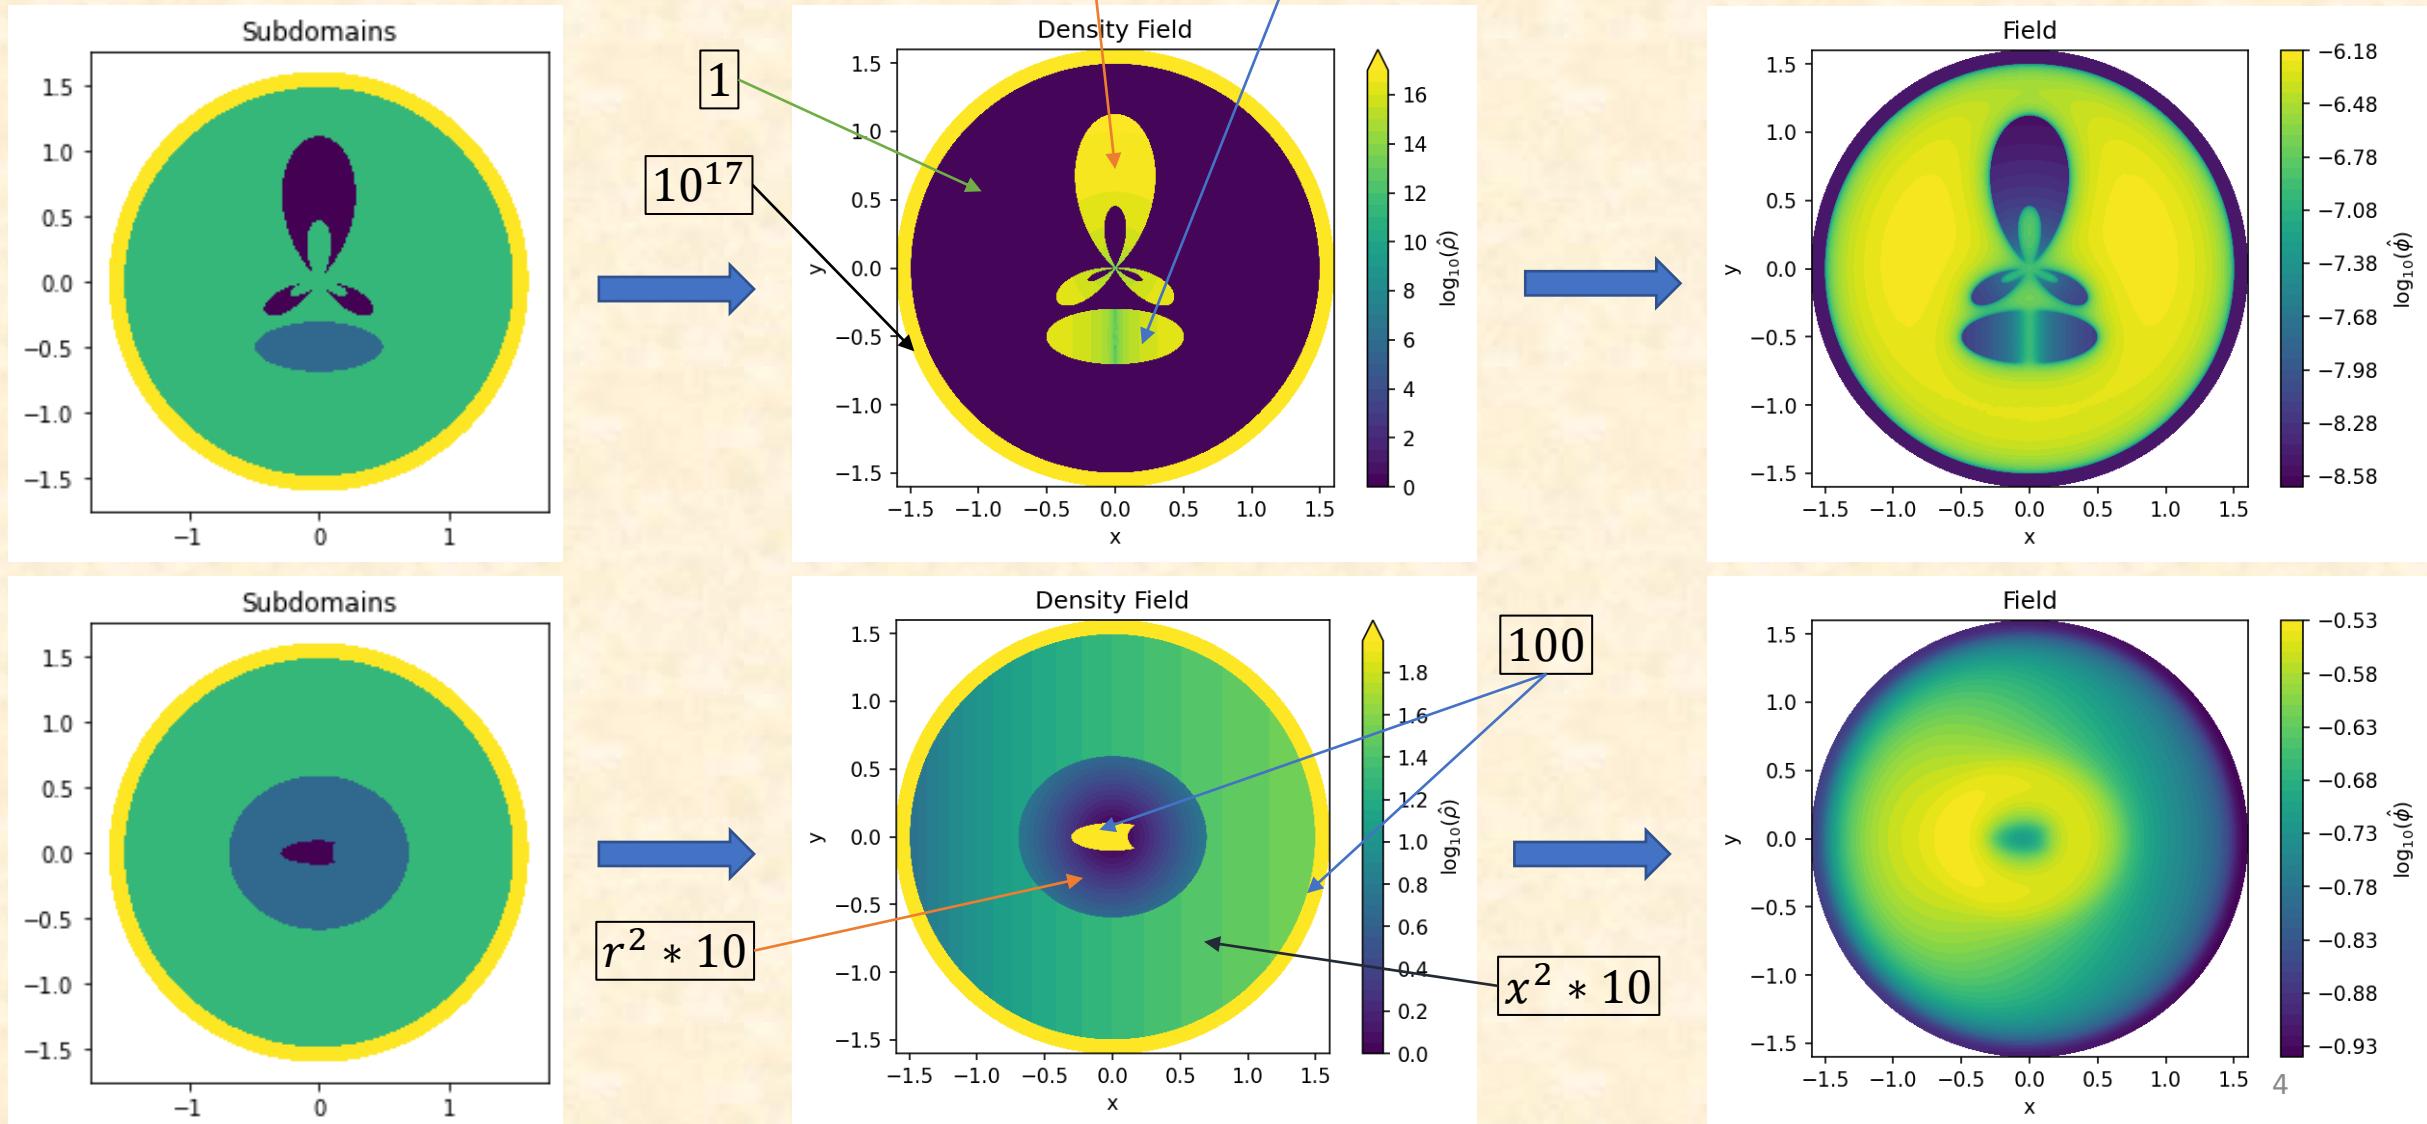

$$\lambda^2 = \frac{(n \Lambda^{n+4})^{1/(n+1)}}{(n+1)} \left(\frac{\beta \rho}{M_{pl}} \right)^{-\frac{n+2}{n+1}}$$

- We see as ρ increases λ deceases leading to the field being screened.

The chameleon of a chameleon

Some Examples
